What is an AI Chatbot?

An AI Chatbot, like ChatGPT, is a computer program that can understand and respond to human questions and commands in a way that simulates conversations, or other forms of communication.

- If you're still aren't sure what ChatGPT is, this is your guide to the world of AI chatbots.

More than One AI

A note on AI use: Most of these AI models are trained on data from the internet, which usually means that the data is biased. How this bias is reflected in the AI's output is not always clear, but once that pattern is identified, most of the time, the AI's output will correct itself to use more neutral language.

During a beta test, the developers of these AI models are often not able to provide the full extent of open access or the full information as it may not be accurate.
